

League of legends has had an explosive following since its release. The game has consistently been the top streamed game over the last 5 – 10 years with consistent updates and worldwide tournaments.

This application will be focus on raw champion statistics out of all games. It will contain a search, where the user can search a champion and get some of the champions stats such as, win percentage, total games, typical role, and so on. This feature will be used for new players to see how their champion handles certain matchups.

The second feature will be something about the playstyle and tag of the user. They can enter the role they like to play and how they like to play. A list of the top 5 most compatible champions will be displayed with the most compatible being at the top. If there is a tie then whoever has the highest win percentage will be number 1.

The third will be an imaging component for captioning. I think this will allow users to drop an image of a champion and we will be able to display the stats for that champion.

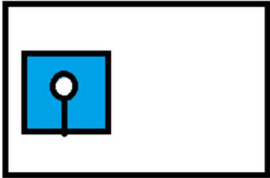

| Win Percentage | Total Games | Playstyle | Role |
|----------------|-------------|-----------|----------|
| 50% | 125120 | Passive | AD Carry |

Role:

Playstyle:

1. Kog'ma
2. Jhin
3. Tristana
4. Vayne
5. Caitlyn
